MUTSCHLER, BRIAN L

ART UNIT PAPER NUMBER

1753

DATE MAILED: 08/27/2003

Please find below and/or attached an Office communication concerning this application or proceeding.

**Office Action Summary**

Application No.

09/955,297

Applicant(s)

ROHR ET AL.

Examiner

Brian L. Mutschler

Art Unit

1753

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 22 July 2003.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-27 and 31-58 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-27 and 31-58 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on \_\_\_\_\_ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

**Priority under 35 U.S.C. §§ 119 and 120**

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

**Attachment(s)**

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449) Paper No(s) 11.
- 4) ☐ Interview Summary (PTO-413) Paper No(s). \_\_\_\_\_
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other:

Art Unit: 1753

**DETAILED ACTION**

***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on July 22, 2003 has been entered.

***Comments***

2. The rejection of claims 10-13 and 27 under 35 U.S.C. § 112, 1<sup>st</sup> paragraph, has been withdrawn in light of Applicant's response, including the declaration of Dr. Anderson, who defined the level of one of ordinary skill in the art as one having a high degree of education and experience in the art.

3. The rejection of claims 2, 3, 4, 7-9, 21, 22, 24 and 35 under 35 U.S.C. § 112, 2<sup>nd</sup> paragraph, has been withdrawn in light of Applicant's response.

4. The rejection of claims 1-5, 7, 16 and 17 under 35 U.S.C. § 102 over Rohr et al. ("STRAIN-BALANCED  $\text{In}_{0.62}\text{Ga}_{0.38}\text{As}/\text{In}_{0.47}\text{Ga}_{0.53}\text{As}$  (InP) QUANTUM WELL CELL FOR THERMOPHOTOVOLTAICS", Conference Record of the 28<sup>th</sup> IEEE Photovoltaic Specialists Conference) has been overcome by Applicant's declaration filed July 22, 2003, which establishes the date of invention before the publishing date of Rohr et al.

5. The rejection of claims 1-6 and 12-14 under 35 U.S.C. § 102 over Ekins-Daukes et al. ("STRAINED AND STRAIN-BALANCED QUANTUM WELL DEVICES FOR HIGH-EFFICIENCY TANDEM SOLAR CELLS", Solar Energy Materials & Solar Cells) has been overcome by Applicant's declaration filed July 22, 2003, which establishes the date of the invention before the publishing date of Ekins-Daukes et al.

***Claim Rejections - 35 USC § 102***

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

Art Unit: 1753

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

7. Claims 1-6, 12, 13, 42 and 43 are rejected under 35 U.S.C. 102(b) as being clearly anticipated by Ekins-Daukes et al. ("STRAIN-BALANCED GaAsP/InGaAs QUANTUM WELL SOLAR CELLS", Applied Physics Letters).

Ekins-Daukes et al. disclose a solar cell having strain-balanced quantum wells, wherein the quantum wells contain alternating compressively strained InGaAs quantum wells and tensile strained GaAsP barriers, and "the dimensions were chosen to ensure the average lattice parameter across the *i* region  $\langle a \rangle$  was equal to that of [the GaAs substrate]", i.e., the strain over each period is zero (p. 4195). Specifically, Ekins-Daukes et al. teach, "The *i* region was designed as a 20 period cyclic half-barrier/QW/half-barrier structure; each half barrier composed of GaAsP alloy, providing half the strain compensation for the InGaAs QW" (see page 4195). Since the strain is zero over each period, each period exhibits zero shear force on neighboring structures, which includes a further period or the substrate. Ekins-Daukes et al. disclose that the average strain is a "negligible quantity" (p. 4195).

Regarding claim 3, the recitation of the lattice constant of the substrate and the quantum wells inherently describes a crystalline device. A lattice constant is a measure of the distance between adjacent atoms in a regularly spaced arrangement, or crystal structure.

Regarding claims 4 and 5, since the quantum well (or barrier) is made of a material having a specific lattice constant, any quantum well (or barrier) having the

Art Unit: 1753

same lattice constant as the substrate would necessarily be made of a different material. Since the comparison material is not defined, the material can be chosen from an infinite number of material compositions having an equal lattice constant and differing bandgap.

Regarding claim 6, a period of one quantum well and one barrier layer contains four elements: In, Ga, As and P.

Regarding claims 12 and 13, Ekins-Daukes et al. disclose the use of a GaAs substrate and InGaAs quantum well layers.

Regarding claims 42 and 43, the quantum wells are compressive strained and the barrier layers are tensile strained (see col. 1 on p. 4195).

Since Ekins-Daukes et al. clearly teach the limitations recited in the instant claims, the reference is deemed to be anticipatory.

***Claim Rejections - 35 USC § 103***

8. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

9. Claims 7-11, 14 and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ekins-Daukes et al. ("STRAIN-BALANCED GaAsP/InGaAs QUANTUM WELL SOLAR CELLS", Applied Physics Letters) in view of Freundlich et al. (U.S. Pat. No. 5,851,310).

Ekins-Daukes et al. disclose a solar cell having the limitations recited in claims 1-6, 12, 13, 42 and 43 of the instant invention, as explained above in section 7.

The device of Ekins-Daukes et al. differs from the instant invention because Ekins-Daukes et al. do not disclose the following:

- a. The substrate is InP and the compressively strained layer is  $\text{In}_x\text{Ga}_{1-x}\text{As}$ , where  $x > 0.53$ , as recited in claim 7;
- b. The substrate is InP and the tensile strained layer is  $\text{In}_x\text{Ga}_{1-x}\text{As}_{1-y}\text{P}_y$ , where  $y > 1$ , as recited in claim 8;
- c. The tensile layer is GaInP, as recited in claim 9;
- d. The substrate is InP and the quantum well is formed of layers of  $\text{Al}_x\text{Ga}_{1-x}\text{As}_y\text{Sb}_{1-y}$ , as recited in claim 10;
- e. The substrate is GaSb and the quantum well is formed of layers of  $\text{In}_x\text{Ga}_{1-x}\text{As}_y\text{Sb}_{1-y}$ , as recited in claim 11;
- f. The quantum well portion is formed on a virtual substrate having a virtual substrate lattice constant different from the lattice constant of the substrate, as recited in claim 14; and
- g. The virtual substrate is  $\text{InP}_{1-y}\text{As}_y$ , where  $0 < y < 1$ , and the substrate is InP, as recited in claim 15.

Regarding claims 7-10 and 15, Freundlich et al. disclose a solar cell having an MQW with an InP substrate (fig. 1). The solar cells use InP because it has a high efficiency (col. 2, lines 30-41).

Art Unit: 1753

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Ekins-Daukes et al. to use an InP substrate as taught by Freundlich et al. because InP cells have a high efficiency.

Regarding claims 7-11, Freundlich et al. disclose that materials usable for fabricating the solar cells include InGaAs and "all alloys of indium gallium arsenide with the addition of iso-valent elements such as phosphorous, aluminum, and antimony in concentrations such that the lattice mismatch is less than 0.3 per cent compared to  $\text{In}_{0.53}\text{Ga}_{0.47}\text{As}$ " (col. 5, lines 26-39). Freundlich et al. further disclose a specific example using  $\text{In}_x\text{Ga}_{1-x}\text{As}$ , where  $0.48 < x < 0.55$  (col. 5, line 52).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Ekins-Daukes et al. to use materials having the compositions taught by Freundlich et al. because Freundlich et al. teach that "these alloys have somewhat different energy bandgaps, which may be desirable in some applications" (col. 5, lines 32-33).

Regarding claim 11, Freundlich et al. disclose that "indium phosphide or other suitable materials well-known in the art may be used as a substrate" (col. 3, lines 58-59).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Ekins-Daukes et al. to use other

Art Unit: 1753

materials to form the substrate as taught by Freundlich et al. because different substrates can provide different desired properties.

Regarding claim 14, Freundlich et al. disclose the use of buffer layers (virtual substrates) "to accommodate crystal lattice-matching requirements between the sublayer and the top layer of the substrate" (col. 3, lines 58-62).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Ekins-Daukes et al. to use a virtual substrate as taught by Freundlich et al. because a virtual substrate helps "accommodate crystal lattice-matching requirements" between the different layers (col. 3, lines 58-62).

Regarding claim 15, Freundlich et al. disclose the use of alloys contained within the indium gallium arsenide series including phosphorous-containing alloys such as InAsP (col. 5, lines 26-39). The buffer layers are chosen to "accommodate crystal lattice-matching requirements" (col. 3, lines 58-62).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Ekins-Daukes et al. to use a virtual substrate of InPAs because Freundlich et al. teach that the solar cell can be made of many different alloys depending on the desired bandgaps and the buffer layer should "accommodate crystal lattice-matching requirements", which would be accomplished by the choice of materials with similar properties.

10. Claims 16 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ekins-Daukes et al. ("STRAIN-BALANCED GaAsP/InGaAs QUANTUM WELL SOLAR CELLS", Applied Physics Letters) in view of Freundlich et al. (U.S. Pat. No. 6,150,604).

Ekins-Daukes et al. disclose a solar cell having the limitations recited in claims 1-6, 12, 13, 42 and 43 of the instant invention, as explained above in section 7.

The device of Ekins-Daukes et al. differs from the instant invention because Ekins-Daukes et al. do not disclose that the device is a thermophotovoltaic device and that the quantum wells have a bandgap equal to or less than 0.73 eV.

Freundlich et al. disclose a MQW thermophotovoltaic solar cell having a bandgap of 0.49-0.74 eV (Table III). The narrow bandgap quantum wells "allows for more efficient conversion of the IR emission emanating from a black body or selective emitter over a wider range of wavelengths than a conventional single junction cell and decreases transparency losses of the conventional cell" (col. 2, lines 40-45).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Ekins-Daukes et al. to use narrow bandgap quantum wells as taught by Freundlich et al. because narrow bandgap quantum wells "allows for more efficient conversion of the IR emission" (col. 2, lines 40-45).

Art Unit: 1753

11. Claims 18, 23 and 25-27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Freundlich et al. (U.S. Pat. No. 5,851,310).

Freundlich et al. disclose the use of buffer layers (virtual substrates) "to accommodate crystal lattice-matching requirements between the sublayer and the top layer of the substrate" in MQW solar cells (col. 3, lines 58-62). Freundlich et al. also disclose the use of alloys contained within the indium gallium arsenide series, including phosphorous, aluminum and antimony alloys (col. 5, lines 26-39). The photovoltaic cell is formed on an InP substrate (fig. 1). Freundlich et al. further disclose that the alternating layers in the quantum well portion "are alternately in tensile and compressive strain...[to] reduce the overall strain magnitude in the heterostructure" (col. 7, lines 47-52).

Regarding claims 23, 25 and 26, the solar cell is formed on an InP substrate and the quantum well portion comprises four elements: In, Ga, As and P (col. 7, lines 54-55). The lattice constant of each period is the same as the adjacent periods (see Table I). In the embodiment comprising an InAsP/InGaP quantum well system, the InGaP is the tensile strained layer (col. 7, lines 54-55).

Regarding claim 27, Freundlich et al. also disclose the use of GaAsSb in the formation of the solar cell (col. 5, lines 26-39).

The device of Freundlich et al. differs from the instant invention because Freundlich et al. do not disclose the use of an InAsP virtual substrate.

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Freundlich et al. to use a virtual

Art Unit: 1753

substrate of InPAs because Freundlich et al. teach that the solar cell can be made of many different alloys depending on the desired bandgaps and the buffer layer should "accommodate crystal lattice-matching requirements", which would be accomplished by the choice of materials with similar properties.

12. Claims 19-22 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Freundlich et al. (U.S. Pat. No. 5,851,310), as applied to claims 18, 21-23 and 25-27, and further in view of Ekins-Daukes et al. ("STRAIN-BALANCED GaAsP/InGaAs QUANTUM WELL SOLAR CELLS", Applied Physics Letters).

Freundlich et al. disclose a solar cell having the limitations recited in claims 18, 23 and 25-27 of the instant invention, as explained above in section 11. Freundlich et al. further disclose that the alternating layers in the quantum well portion "are alternately in tensile and compressive strain...[to] reduce the overall strain magnitude in the heterostructure" (col. 7, lines 47-52). Regarding claims 21 and 22, since the quantum well (or barrier) is made of a material having a specific lattice constant, any quantum well (or barrier) having the same lattice constant as the substrate would necessarily be made of a different material. Since the comparison material is not defined, the material can be chosen from an infinite number of material compositions having an equal lattice constant and differing bandgap.

The device of Freundlich et al. differs from the instant invention because Freundlich et al. do not disclose the following:

- a. A period comprising a quantum well layer and a barrier layer exerts no shear stress on a neighboring structure, as recited in claim 19;
- b. The neighboring structure is a further period, a layer of arbitrary doping, or the virtual substrate, as recited in claim 20; and
- c. The compressively strained layer is InGaAs having a larger percentage of indium than the InGaAs composition having the same lattice constant as the virtual substrate, as recited in claim 24.

Regarding claims 19 and 20, Ekins-Daukes et al. teach strain-balancing the quantum well layers and the barrier layers in the solar cells so that no strain exists between the layers (p. 4195). This approach allows more quantum wells to be incorporated in the solar cell without causing strain relaxation (p. 4195).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Freundlich et al. to strain-balance the quantum well portion as taught by Ekins-Daukes et al. because balancing the strain within the quantum well portion allows more quantum wells to be used, thus increasing the efficiency of the solar cell.

Regarding claim 24, Ekins-Daukes et al. disclose the use of compressively strained InGaAs layers (p. 4195). Since the layer is compressively strained, the lattice constant is greater than the other layers including the virtual substrate. A layer of InGaAs with a lattice constant the same as the virtual substrate would have a lower concentration of indium.

Art Unit: 1753

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Freundlich et al. to use compressively strained InGaAs layers as taught by Ekins-Daukes et al. because InGaAs quantum wells have been shown by Ekins-Daukes et al. to increase the conversion efficiency of conventional solar cells.

13. Claims 31-33 and 36-41 are rejected under 35 U.S.C. 103(a) as being unpatentable over Freundlich et al. (U.S. Pat. No. 5,851,310), as applied to claims 18, 23 and 25-27, and further in view of Freundlich et al. (U.S. Pat. No. 6,150,604).

In US '310, Freundlich et al. disclose a solar cell having the limitations recited in claims 18, 23 and 25-27 of the instant invention, as explained above in section 11.

The device of Freundlich et al. (US '310) differs from the instant invention because Freundlich et al. do not disclose the following:

- a. The device is a thermophotovoltaic device, as recited in claims 31 and 40;
- b. The quantum wells have a bandgap of 0.73 eV or less, as recited in claims 32 and 41;
- c. The quantum well is comprised of alternating layers of  $\text{In}_x\text{Ga}_{1-x}\text{As}$ , where  $x > 0.53$ , and barrier layers of  $\text{Ga}_y\text{In}_{1-y}\text{P}$ , where  $y > 0$ , as recited in claim 33; and
- d. The virtual substrate is InPAs, as recited in claim 39.

Regarding claims 31, 32, 40 and 41, Freundlich et al. (US '604) disclose a MQW thermophotovoltaic solar cell having a bandgap of 0.49-0.74 eV (Table III). The narrow

Art Unit: 1753

bandgap quantum wells “allows for more efficient conversion of the IR emission emanating from a black body or selective emitter over a wider range of wavelengths than a conventional single junction cell and decreases transparency losses of the conventional cell” (col. 2, lines 40-45).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Freundlich et al. (US '310) to use narrow bandgap quantum wells as taught by Freundlich et al. (US '604) because narrow bandgap quantum wells “allows for more efficient conversion of the IR emission” (col. 2, lines 40-45).

Regarding claim 33, Freundlich et al. (US '310) disclose the use of alloys contained within the indium gallium arsenide series, including phosphorous, aluminum and antimony alloys (col. 5, lines 26-39). The photovoltaic cell is formed on an InP substrate (fig. 1). In one embodiment, Freundlich et al. disclose an InAsP/InGaP quantum well system, the InGaP is the tensile strained layer (col. 7, lines 54-55).

Freundlich et al. (US '604) disclose the use of InGaAs wells under compressive strain, with a specific example of wells comprising  $\text{In}_{0.9}\text{Ga}_{0.1}\text{As}$  (col. 5, line 9).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Freundlich et al. (US '310) to use a compressively strained InGaAs layer having a high indium concentration as taught by Freundlich et al. (US '604) because an InGaAs layer with a high indium concentration has a narrower bandgap, which increases the absorption of the IR regions.

Regarding claim 39, it would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Freundlich et al. to use a virtual substrate of InPAs because Freundlich et al. teach that the solar cell can be made of many different alloys depending on the desired bandgaps and the buffer layer should "accommodate crystal lattice-matching requirements", which would be accomplished by the choice of materials with similar properties.

14. Claims 34 and 35 are rejected under 35 U.S.C. 103(a) as being unpatentable over Freundlich et al. (U.S. Pat. No. 5,851,310) in view of Freundlich et al. (U.S. Pat. No. 6,150,604), as applied above to claims 31-33 and 36-41, and further in view of Ekins-Daukes et al. ("STRAIN-BALANCED GaAsP/InGaAs QUANTUM WELL SOLAR CELLS", Applied Physics Letters).

Freundlich et al. (US '310 and US '604) disclose a solar cell having the limitations recited in claims 31-33 and 36-41 of the instant invention, as explained above in section 13.

The device described by US '310 and US '604 differs from the instant invention because they do not disclose that a period of one tensile strained layer and one compressively strained layer exerts no shear force on a neighboring structure.

Ekins-Daukes et al. teach strain-balancing the quantum well layers and the barrier layers in the solar cells so that no strain exists between the layers (p. 4195).

Art Unit: 1753

This approach allows more quantum wells to be incorporated in the solar cell without causing strain relaxation (p. 4195).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Freundlich et al. (US '310 and US '604) to strain-balance the quantum well portion as taught by Ekins-Daukes et al. because balancing the strain within the quantum well portion allows more quantum wells to be used, thus increasing the efficiency of the solar cell.

15. Claims 44-47, 53 and 54 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ekins-Daukes et al. ("STRAIN-BALANCED GaAsP/InGaAs QUANTUM WELL SOLAR CELLS", Applied Physics Letters).

Ekins-Daukes et al. disclose a solar cell having strain-balanced quantum wells, wherein the quantum wells contain alternating compressively strained InGaAs quantum wells and tensile strained GaAsP barriers, and "the dimensions were chosen to ensure the average lattice parameter across the *i* region  $\langle a \rangle$  was equal to that of [the GaAs substrate]", i.e., the strain over each period is zero (p. 4195). Specifically, Ekins-Daukes et al. teach, "The *i* region was designed as a 20 period cyclic half-barrier/QW/half-barrier structure; each half barrier composed of GaAsP alloy, providing half the strain compensation for the InGaAs QW" (see page 4195). Since the strain is zero over each period, each period exhibits zero shear force on neighboring structures, which includes a further period or the substrate. Ekins-Daukes et al. disclose that the

Art Unit: 1753

average strain is a "negligible quantity" (p. 4195). The strain across one period is a function of the thickness and the material properties of each layer (p. 4195).

Regarding claims 45 and 46, since the quantum well (or barrier) is made of a material having a specific lattice constant, any quantum well (or barrier) having the same lattice constant as the substrate would necessarily be made of a different material. Since the comparison material is not defined, the material can be chosen from an infinite number of material compositions having an equal lattice constant and differing bandgap.

Regarding claim 47, a period of one quantum well and one barrier layer contains four elements: In, Ga, As and P.

Regarding claims 53 and 54, Ekins-Daukes et al. disclose the use of a GaAs substrate and InGaAs quantum well layers.

The photovoltaic device of Ekins-Daukes et al. differs from the instant invention because Ekins-Daukes et al. do not disclose equations recited in the claims, especially in regard to the elastic stiffness coefficient, as recited in claim 44.

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have made the photovoltaic device substantially meeting the conditions defined by the equations recited in the instant claims because one of ordinary skill in the art would have recognized that the elastic stiffness coefficient influences the strain within the layers and therefore would have been encompassed by the teachings of Ekins-Daukes et al., who clearly desire that each barrier compensates for the strain of the adjacent quantum well. The person of ordinary skill in the art, who is

Art Unit: 1753

“a highly skilled and experienced individual” (see page 23 of Applicant’s response), would recognize the relationship between the different material properties, such as lattice constant and elastic stiffness coefficient, and their influences on the strain between adjacent layers. As can be seen in the equations recited in the claims and the teachings of Ekins-Daukes et al., the final result is the same; each barrier provides the strain compensation of the adjacent quantum well.

16. Claims 48-52, 55 and 56 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ekins-Daukes et al. (“STRAIN-BALANCED GaAsP/InGaAs QUANTUM WELL SOLAR CELLS”, Applied Physics Letters), as applied above to claims 44-47, 53 and 54, in view of Freundlich et al. (U.S. Pat. No. 5,851,310).

Ekins-Daukes et al. teach the limitations recited in claims 44-47, 53 and 54 of the instant invention, as explained above in section 15.

The device of Ekins-Daukes et al. differs from the instant invention because Ekins-Daukes et al. do not disclose the following:

- a. The substrate is InP and the compressively strained layer is  $\text{In}_x\text{Ga}_{1-x}\text{As}$ , where  $x > 0.53$ , as recited in claim 48;
- b. The substrate is InP and the tensile strained layer is  $\text{In}_x\text{Ga}_{1-x}\text{As}_{1-y}\text{P}_y$ , where  $y > 1$ , as recited in claim 49;
- c. The tensile layer is GaInP, as recited in claim 50;
- d. The substrate is InP and the quantum well is formed of layers of  $\text{Al}_x\text{Ga}_{1-x}\text{As}_y\text{Sb}_{1-y}$ , as recited in claim 51;

Art Unit: 1753

- e. The substrate is GaSb and the quantum well is formed of layers of  $\text{In}_x\text{Ga}_{1-x}\text{As}_y\text{Sb}_{1-y}$ , as recited in claim 52;
- f. The quantum well portion is formed on a virtual substrate having a virtual substrate lattice constant different from the lattice constant of the substrate, as recited in claim 55; and
- g. The virtual substrate is  $\text{InP}_{1-y}\text{As}_y$ , where  $0 < y < 1$ , and the substrate is InP, as recited in claim 56.

Regarding claims 48-51 and 56, Freundlich et al. disclose a solar cell having an MQW with an InP substrate (fig. 1). The solar cells use InP because it has a high efficiency (col. 2, lines 30-41).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Ekins-Daukes et al. to use an InP substrate as taught by Freundlich et al. because InP cells have a high efficiency.

Regarding claims 48-52, Freundlich et al. disclose that materials usable for fabricating the solar cells include InGaAs and "all alloys of indium gallium arsenide with the addition of iso-valent elements such as phosphorous, aluminum, and antimony in concentrations such that the lattice mismatch is less than 0.3 per cent compared to  $\text{In}_{0.53}\text{Ga}_{0.47}\text{As}$ " (col. 5, lines 26-39). Freundlich et al. further disclose a specific example using  $\text{In}_x\text{Ga}_{1-x}\text{As}$ , where  $0.48 < x < 0.55$  (col. 5, line 52).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Ekins-Daukes et al. to use materials

Art Unit: 1753

having the compositions taught by Freundlich et al. because Freundlich et al. teach that “these alloys have somewhat different energy bandgaps, which may be desirable in some applications” (col. 5, lines 32-33).

Regarding claim 48, Freundlich et al. disclose that “indium phosphide or other suitable materials well-known in the art may be used as a substrate” (col. 3, lines 58-59).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Ekins-Daukes et al. to use other materials to form the substrate as taught by Freundlich et al. because different substrates can provide different desired properties.

Regarding claim 55, Freundlich et al. disclose the use of buffer layers (virtual substrates) “to accommodate crystal lattice-matching requirements between the sublayer and the top layer of the substrate” (col. 3, lines 58-62).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Ekins-Daukes et al. to use a virtual substrate as taught by Freundlich et al. because a virtual substrate helps “accommodate crystal lattice-matching requirements” between the different layers (col. 3, lines 58-62).

Art Unit: 1753

Regarding claim 56, Freundlich et al. disclose the use of alloys contained within the indium gallium arsenide series including phosphorous-containing alloys such as InAsP (col. 5, lines 26-39). The buffer layers are chosen to "accommodate crystal lattice-matching requirements" (col. 3, lines 58-62).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Ekins-Daukes et al. to use a virtual substrate of InPAs because Freundlich et al. teach that the solar cell can be made of many different alloys depending on the desired bandgaps and the buffer layer should "accommodate crystal lattice-matching requirements", which would be accomplished by the choice of materials with similar properties.

17. Claims 57 and 58 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ekins-Daukes et al. ("STRAIN-BALANCED GaAsP/InGaAs QUANTUM WELL SOLAR CELLS", Applied Physics Letters), as applied above to claims 44-47, 53 and 54, in view of Freundlich et al. (U.S. Pat. No. 6,150,604).

Ekins-Daukes et al. teach the limitations recited in claims 44-47, 53 and 54 of the instant invention, as explained above in section 15.

The device of Ekins-Daukes et al. differs from the instant invention because Ekins-Daukes et al. do not disclose that the device is a thermophotovoltaic device and that the quantum wells have a bandgap equal to or less than 0.73 eV.

Freundlich et al. disclose a MQW thermophotovoltaic solar cell having a bandgap of 0.49-0.74 eV (Table III). The narrow bandgap quantum wells "allows for more

Art Unit: 1753

efficient conversion of the IR emission emanating from a black body or selective emitter over a wider range of wavelengths than a conventional single junction cell and decreases transparency losses of the conventional cell" (col. 2, lines 40-45).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the device of Ekins-Daukes et al. to use narrow bandgap quantum wells as taught by Freundlich et al. because narrow bandgap quantum wells "allows for more efficient conversion of the IR emission" (col. 2, lines 40-45).

### ***Response to Arguments***

18. Applicant's arguments filed July 22, 2003 have been fully considered but they are not persuasive.

19. Regarding the rejection of the claims, Applicant argues, "Ekins-Daukes I teaches the desirability of having 'compositions such that a period of one tensile strained layer and one compressively strained layer exerts substantially no shear force on a neighboring structure' but does not teach a method of achieving this desired result" (see page 24 of Applicant's response). Furthermore, Applicant argues, "As stated in paragraph 12 of the Rule 32 Declaration, Dr. Anderson testifies that the methods taught in Ekins-Daukes I are 'insufficiently exact to ensure periods which exert 'substantially no shear force on a neighboring structure'" (see page 24 of Applicant's response).

20. These arguments are not persuasive for several reasons. First, Applicant is not claiming a method for making a photovoltaic device, they are claiming the photovoltaic

Art Unit: 1753

device. Second, Ekins-Daukes clearly teaches, "The *i* region was designed as a 20 period cyclic half-barrier/QW/half-barrier structure; each half barrier composed of GaAsP alloy, providing half the strain compensation for the InGaAs QW" (see page 4195). Since the strain is zero over each period, each period exhibits substantially zero shear force on its neighboring structures. It is also noted that, although the methods used by Ekins-Daukes et al. may be "insufficiently exact", the device disclosed by Ekins-Daukes et al. is capable of producing MQW photovoltaic devices that exert a "negligible quantity" of strain, which fully satisfies the limitation wherein a period of one tensile strained layer and one compressively strained layer exert "substantially no shear force on a neighboring structure", as recited, for example, in claim 1.

21. Applicant's arguments regarding the other rejections are based on the argument that Ekins-Daukes et al. do not teach a compressive strained layer and a tensile strained layer exerting substantially no shear force on one another.

### ***Conclusion***

22. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brian L. Mutschler whose telephone number is (703) 305-0180. The examiner can normally be reached on Monday-Friday from 8:00am to 4:30pm.

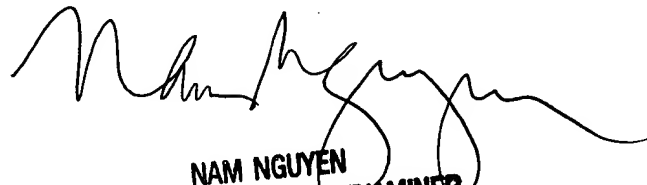

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nam Nguyen can be reached on (703) 308-3322. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.
